

New: the classical Islamic library API is now public — hundreds of classical books across 11 genres, full PDFs from R2 + AI semantic search. No signup.

≡ Audio > GET /v1/audio/ayah — Single ayah audio

Audio

GET /v1/audio/ayah — Single ayah audio

Get the MP3 audio for a single Quran ayah by reciter and global ayah number. Returns a 302 redirect to the CDN URL.

Returns a **302 redirect** to the MP3 file on `cdn.islamic.app`. Use this in audio players, `<audio>` elements, or any HTTP client that follows redirects.

Endpoint

```
GET https://api.islamic.app/v1/audio/ayah/:reciter/:number
```

Path parameters

reciter `string` **required**

Reciter identifier, e.g. `ar.alafasy`, `ar.abdurrahmaansudais`, `taraweeh.madinah.1442`. See [reciters](#) for the full catalogue — only reciters whose `audioLevels` includes `"ayah"` support this endpoint.

Validation: must match `^[a-zA-Z0-9][a-zA-Z0-9._-]{0,79}$` — alphanumerics plus dot, dash, and underscore. Path-shaped slugs (containing `..` or `/`) are rejected with `400` before R2 ever sees the value, even if URL-decoded. Empty / wrong-shape inputs return `400 "reciter must be a valid slug..."`.

ⓘ Not every reciter has ayah-level audio. Check the `audioLevels` array on each entry from [/v1/audio/reciters](#) — a reciter supports this endpoint only if `"ayah"` appears in its `audioLevels`.

New: the classical Islamic library API is now public — hundreds of classical books across 11 genres, full PDFs from R2 + AI semantic search. No signup.

Global ayah number, 1 to 6236 .

islamic.app

Example request

curl javascript HTML

Follow the redirect (-L)

```
curl -L https://api.islamic.app/v1/audio/ayah/ar.alafasy/1 -o ayah1.mp3
```

Or get the CDN URL without downloading

```
curl -I https://api.islamic.app/v1/audio/ayah/ar.alafasy/1
```

Redirect behavior

The API returns 302 Found with a Location header pointing to the CDN URL:

HTTP/1.1 302 Found

Location: https://cdn.islamic.app/quran/audio/ar.alafasy/1.mp3

Cache-Control: public, max-age=604800

Access-Control-Allow-Origin: *

Browsers and most HTTP clients follow this redirect automatically. The CDN serves the MP3 directly from Cloudflare R2 object storage.

Since the CDN URL is stable, you can also request it directly:

https://cdn.islamic.app/quran/audio/{reciter}/{number}.mp3 . The API redirect is useful when you want to verify the file exists before sending users to it (the API returns 404 if the audio isn't available for that reciter).

Errors

 New: the classical Islamic library API is now public — hundreds of classical books across 11 genres, full PDFs from R2 + AI semantic search. No signup.

400 Ayah number out of range (must be 1–6236)

 **islamic.app**
404 Audio file does not exist for that reciter + ayah combination

```
{
  "code": 404,
  "status": "Not Found",
  "data": "Audio not found for ar.alafasy ayah 6236"
}
```
